Polishing plots for presentation

Hadley Wickham

Communication graphics

When you need to **communicate** your findings, you need to spend a lot of time polishing your graphics to eliminate distractions and focus on the story.

Now it's time to pay attention to the small stuff: labels, colour choices, tick marks...

- 1. Scales: used to override default perceptual mappings, and tune parameters of axes and legends.
- 2. Coordinate systems: override default Cartesian coordinate system
- 3. **Themes**: control presentation of non-data elements.
- 4. Saving your work: to include in reports, presentations, etc.

Scales

Control how data is mapped to perceptual properties, and produce **guides** (axes and legends) which allow us to read the plot.

Important parameters: name, breaks & labels, limits.

Naming scheme: scale_*aesthetic_name*. All default scales have name continuous or discrete. # Default scales
scale_x_continuous()
scale_y_discrete()
scale_colour_discrete()

Custom scales
scale_colour_hue()
scale_x_log10()
scale_fill_brewer()

Scales with parameters
scale_x_continuous("X Label", limits = c(1, 10))
scale_colour_gradient(low = "blue", high = "red")

p <- qplot(cyl, displ, data = mpg)</pre>

First argument (name) controls axis label
p + scale_y_continuous("Displacement (1)")
p + scale_x_continuous("Cylinders")

Breaks and labels control tick marks
p + scale_x_continuous(breaks = c(4, 6, 8))
p + scale_x_continuous(breaks = c(4, 6, 8),
 labels = c("small", "medium", "big"))

```
# Limits control range of data
p + scale_y_continuous(limits = c(1, 8))
# same as:
```

```
p + ylim(1, 8)
```

Your turn

qplot(carat, price, data = diamonds, geom = "bin2d")
Manipulate the fill colour legend to:

- Change the title to "Count"
- Display breaks at 1000, 3500 & 7000
- Add commas to the keys (e.g. 1,000)
- Set the limit for the scale from 0 to 8000.

p <- qplot(carat, price, data = diamonds, geom = "hex")</pre>

First argument (name) controls legend title
p + scale_fill_continuous("Count")

```
# Breaks and labels control legend keys
p + scale_fill_continuous(breaks = c(1000, 3500, 7000))
p + scale_fill_continuous(breaks = c(0, 4000, 8000))
```

```
# Why don't 0 and 8000 have colours?
p + scale_fill_continuous(breaks = c(0, 4000, 8000),
    limits = c(0, 8000))
```

p <- qplot(color, carat, data = diamonds)</pre>

Basically the same for discrete variables
p + scale_x_discrete("Color")

Except limits is now a character vector
p + scale_x_discrete(limits = c("D", "E", "F"))

```
# Should work for boxplots too
qplot(color, carat, data = diamonds,
geom = "boxplot") +
scale_x_discrete(limits = c("D", "E", "F"))
```

Alternate scales

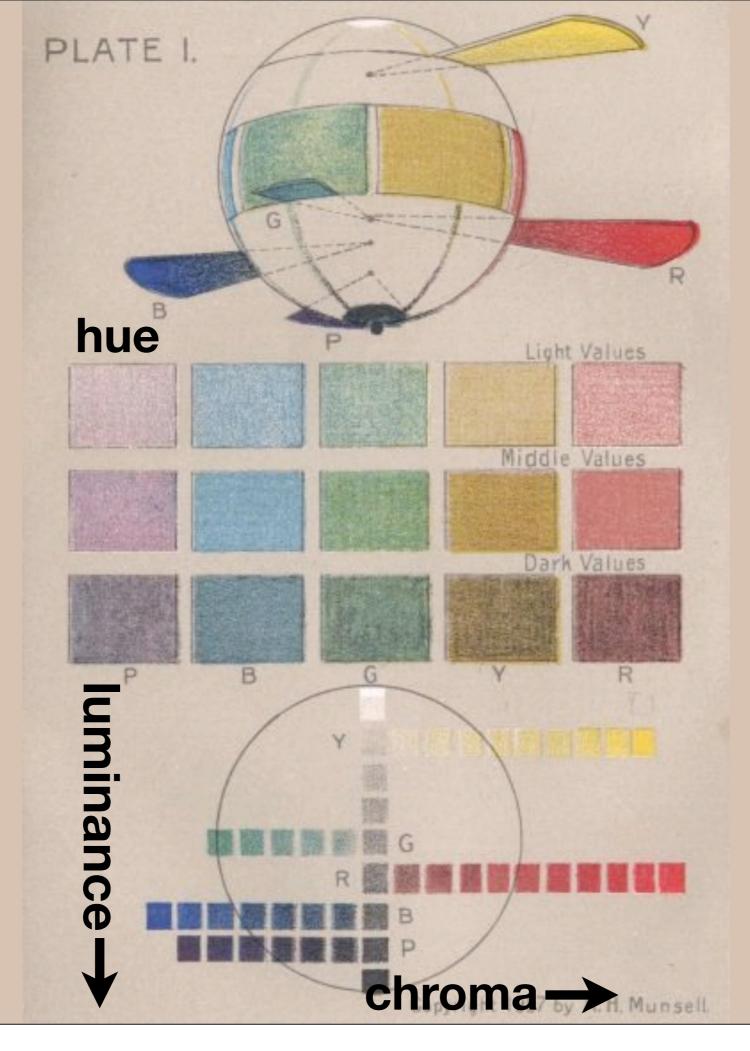

Can also override the default choice of scales. You are most likely to want to do this with **colour**, as it is the most important aesthetic after position.

Need a little background to be able to use colour effectively: colour **spaces** & colour **blindness**.

Colour spaces

Most familiar is **rgb**: defines colour as mixture of **red**, **green** and **blue**. Matches the physics of eye, but the brain does a lot of post-processing, so it's hard to directly perceive these components.

A more useful colour space is hcl: hue, chroma and luminance

Friday, September 23, 11

Default colour scales

Discrete: evenly spaced hues of equal chroma and luminance. No colour appears more important than any other. Does not imply order.

Continuous: evenly spaced hues between two colours.

Alternatives

Discrete: brewer, grey Continuous: gradient2, gradientn

Color brewer

Cynthia Brewer applied basics principles and then rigorously tested to produce selection of good palettes, particularly tailored for maps: http://colorbrewer2.org/

Can use cut_interval() or cut_number() to convert continuous to discrete.

Colour blindness

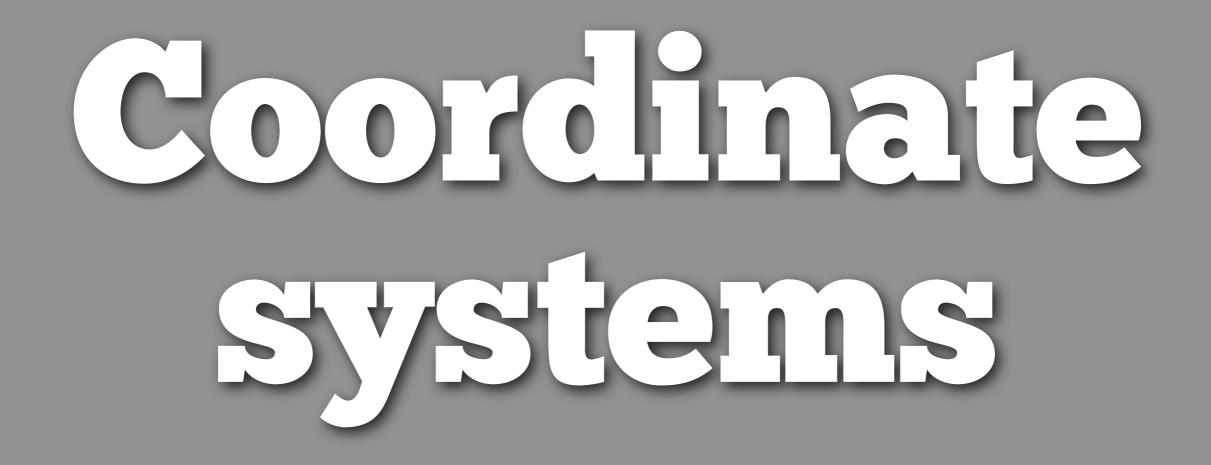

7-10% of men are red-green colour "blind". (Many other rarer types of colour blindness)

Solutions: avoid red-green contrasts; use redundant mappings; **test**. I like color oracle: http://colororacle.cartography.ch

Your turn

Read through the examples for scale_colour_brewer, scale_colour_gradient2 and scale_colour_gradientn.

Experiment!

Friday, September 23, 11

```
# For spatial data:
coord_map()
```

To zoom in on plot coord_cartesian(xlim = ..., ylim = ...)

Polar coordinates
coord_polar()

Equal coordinates
coord_equal()

Hanes

Visual appearance

So far have only discussed how to get the data displayed the way you want, focussing on the essence of the plot.

Themes give you a huge amount of control over the appearance of the plot, the choice of background colours, fonts and so on. # Two built in themes. The default: qplot(carat, price, data = diamonds)

And a theme with a white background:
qplot(carat, price, data = diamonds) + theme_bw()

Use theme_set if you want it to apply to every # future plot. theme_set(theme_bw())

This is the best way of seeing all the default
options
theme_bw()
theme_grey()

Elements

You can also make your own theme, or modify and existing.

Themes are made up of elements which can be one of: theme_line, theme_segment, theme_text, theme_rect, theme_blank

Gives you a lot of control over plot appearance.

Elements

Axis: axis.line, axis.text.x, axis.text.y, axis.ticks, axis.title.x, axis.title.y

Legend: legend.background, legend.key, legend.text, legend.title

Panel: panel.background, panel.border, panel.grid.major, panel.grid.minor

Strip: strip.background, strip.text.x, strip.text.y

- p <- qplot(displ, hwy, data = mpg) +
 opts(title = "Bigger engines are less efficient")</pre>
- # To modify a plot

р

p + opts(plot.title =
 theme_text(size = 12, face = "bold"))
p + opts(plot.title = theme_text(colour = "red"))
p + opts(plot.title = theme_text(angle = 45))
p + opts(plot.title = theme_text(hjust = 1))

Your turn

- Fix the overlapping y labels on this plot: qplot(reorder(model, hwy), hwy, data = mpg)
- Rotate the labels on these strips so they are easier to read.

qplot(hwy, reorder(model, hwy), data =
mpg) + facet_grid(manufacturer ~ .,
scales = "free", space = "free")

Saving your work

```
qplot(price, carat, data = diamonds)
ggsave("diamonds.png")
```

Selects graphics device based on extension
ggsave("diamonds.png")
ggsave("diamonds.pdf")

Uses on-screen device size, or override with # width & height (to be reproducible) ggsave("diamonds.png", width = 6, height = 6)

Outputs last plot by default, override
with plot:
dplot <- qplot(carat, price, data = diamonds)
ggsave("diamonds.png", plot = dplot)</pre>

Defaults to 300 dpi for png
ggsave("diamonds.png", dpi = 72)

Raster	Vector
pixel-based	instruction-based
png	pdf
for plots with many points	for all other plots
ms office, web	latex

Your turn

- Save a pdf of a scatterplot of price vs carat. Open it up in adobe acrobat.
- Save a png of the same scatterplot and embed it into a word or latex document.
